

GME® Walkway Bridge

Provides Safe Access To Your Trench Shields

For over three decades, GME has engineered and manufactured trench shoring solutions to improve worker safety in the trenches and help boost productivity.

Now we've taken safety a few steps further. The new, patented GME Walkway Bridge brings added safety to the jobsite by giving workers an easier way to enter and exit the trench.

The Walkway Bridge can be pre-assembled and trucked to the site on a flatbed, or assembled right at the jobsite.

When installed, the Walkway Bridge adjusts to the slope of the spoil piles surrounding the trench. Workers simply climb a ladder to the walkway platform, and can enter and exit without having to walk onto the spoil pile itself.

The GME Walkway Bridge adds an extra measure of safety to your jobsite by giving workers a clear point of entry to the trench.

For complete technical specifications and purchase or rental information, contact GME or your local GME Distributor.

An assembled Walkway Bridge being moved into position at the jobsite.

The platform of the Walkway Bridge is securely fastened to the sidewall of the trench shield with an adjustable clamp that fits over the sidewall (far left) and is secured with a ratchet binder.
